

# GIT COPILOT

01 July 2025 17:08

## What is GitHub Copilot?

GitHub Copilot is an AI tool that helps you write code faster and smarter.

It's like having a super-intelligent coding partner sitting next to you.

### 💡 What Can Copilot Do?

- 🛠️ Writes code for you – Just type a comment or a few lines, and it will suggest the rest.
- 💡 Suggests better solutions – It helps you improve your code.
- 🧪 Helps with testing – It can generate test cases.
- 🛠️ Refactors code – Makes your code cleaner and better organized.
- 🧠 Explains code – It can explain what complex code is doing in simple language.

### 🏠 What is Agent Mode?

This is a new powerful feature in Copilot:

- It can understand your goal and do multi-step tasks.
- It acts more like a smart teammate than just a code helper.
- For example, you can say:
  - 👉 *“Create a login page and connect it to a database”*
  - Copilot will generate and even improve that whole setup.

### 💬 How Does It Work?

- You give it natural language prompts (like English instructions).
- Copilot turns those into working code.
- This saves time and reduces the stress of figuring everything out yourself.
